ABSTRACT

As one of its options, the Haystack pointing system can track satellites. Given mean orbital parameters of the type used by the Smithsonian Astrophysical Observatory, the Satellite program obtains osculating elements where the perturbations are caused by the ellipsoidal shape of the earth. From these elements, the program computes celestial coordinates and their rates of change which are used by other programs in the pointing system to provide antenna pointing angles, range, and doppler.

I. INTRODUCTION

The Satellite Celestial Computation Program (SATEL) was developed for the UNIVAC 490 used as part of the pointing system for the Haystack radar antenna operated by Lincoln Laboratory. Written in SPURT assembly language, this program calculates pointing information in celestial coordinates for a selected path of an earth satellite. Basically, it performs the calculations necessary to convert mean orbital elements valid as of a certain day to instantaneous (osculating) elements valid as of the time of computation; from these it then determines celestial coordinates and their first time derivatives for the object in orbit.

SATEL is divided into two main sections: an initialization and a working section. When the initialization section is entered with L(SYSTAT1) set to -0, the operator types in the requested parameters on the on-line typewriter; when entered with L(SYSTAT1) set to +0, the operator may examine the previous input values and, optionally, change or use them again. When the initialization section is entered with L(KYBRDLEVEL) not set to +0, no new input values may be entered and the program continues with the previous input values updated to the present time.

The initialization section is entered only once during initialization, but it may be re-entered an indefinite number of times for reinitialization purposes. When the working section is entered, a calculation is made for the right ascension, declination, range, and their derivatives as well as the sine and cosine of the orientation angle for the time contained in W(CELTIME). All subroutines save and restore all registers with the exception of B7.

Errors will fall into two general classifications: arithmetic or geometric, or invalid data. If an error occurs, control will be transferred to the location following the return jump to SATEL and the probable location of the error will be left in a word in core. A normal exit will transfer control to two locations after the return jump.

Output (common storage)

<u>Label</u>	<u>Description</u>	<u>Units and Scaling</u>
RA	right ascension, α	revolutions B27
DEC	declination, δ	revolutions B27
SINORIENT	sine of orientation angle, $\sin\beta$	B29
COSORIENT	cosine of orientation angle, $\cos\beta$	B29
RADIUS	radius from center of earth to satellite, ρ	earth radii B22
DECDOT	time derivative of DEC, $d\delta/dt$	radians/sec B37
RADOT	time derivative of RA, $(d\alpha/dt) \cos\delta$	radians/sec B37
RADIUSDOT	time derivative of radius, $d\rho/dt$	nautical miles/sec B24

Storage Areas Read

L(SYSTAT1)	+0 if reinitialization -0 if initialization	
W(CELTIME)	time of computation	days B28
L(KYBRDLEVEL)	$\neq +0$ if previous input to be used	
W(FRAMESIZE)		sec B0
W(TIMEMODE)	+0 if realtime run -0 if simulation run	

Error Conditions

All errors exit to the system error return. The address of the location where the error occurred is left in the Q-register and L(ERRINST).

+0 indicates a calculation error.

Limitations on Present System

e must not = 0.

Declination (DEC) must not = 90° or 270° .

Reinitialization

KYBRDLEVEL $\neq +0$, previous input is updated to zero hours
of the present day, month and year.

KYBRDLEVEL = +0, SYSTAT1 = +0, new data may be entered.

III. SUBROUTINE DESCRIPTIONS

DATAIN

Function

To request if necessary, via the console typewriter, and store as floating-point numbers the input parameters for SATEL.

Calling Sequence

RJP DATAIN
Normal return

Input

See input described in Section II. There must be at least one input parameter in each group with the exception of M_n which must have two, i.e., minimum input is: e_0 , i_0 , w_0 , Ω_0 , M_b , M_l , t_0 (where $M_l = n$, the mean motion and t_0 is the epoch).

Output

The original input parameters in their appropriate storage areas (see below) expressed as floating-point numbers.

Subroutines Used

TWZERO, . . . , TWFIVE
TRAMZERO, . . . , TRAMFIVE
RAMCNT, WCNT, ICNT, ECNT, MCNT, TJMPDELT, DMODE,
VDAY, VMONTH, VYEAR

Error Conditions

Errors made in entering the input are conditions recognized by a printout on the console typewriter and may be corrected by re-entering correct input.

UPCALC

Function

When the specified epoch time of the input parameters differs from the starting time of program, to update the input parameters to zero hours of the day of the starting time of the program.

Calling Sequence

RJP UPCALC
Normal return

Input

Epoch day, epoch month, epoch year, actual day, actual month, actual year, and parameter groups.

Output

Updated parameters in "Storage Areas Written" expressed as floating-point numbers.

Subroutines Used

FF (calls floating-point package)

Storage Areas Read

VDAY, VMONTH, VYEAR, YEARMONTH, DAY

Storage Areas Written

MZERO, . . . , MFOUR
EZERO, . . . , EFOUR
IZEROX, . . . , IFOUR
WZERO, . . . , WFOUR
RAMZERO, . . . , RAMFOUR

Method

The updated parameters for each group are found by means of the following equations:

$$X_0 \text{ (new)} = X_0 + X_1(t-t_0) + X_2(t-t_0)^2 + \dots + X_5(t-t_0)^5$$

$X_1 \text{ (new)} \dots X_4 \text{ (new)}$ are found by taking successive derivatives of $X_0 \text{ (new)}$. Each new parameter in a group is then divided by its appropriate factorial, i.e., $\frac{X_0}{0!}, \frac{X_1}{1!}, \frac{X_2}{2!}, \frac{X_3}{3!}, \frac{X_4}{4!}, \frac{X_5}{5!}$, to complete the updating process.

Error Conditions

None.

BLASTCONV

Function

To convert the time of computation from parts of a day to seconds. All conversions are done in floating-point formats.

Calling Sequence

RJP BLASTCONV
Normal return

Input

Time of computation (parts of a day, binary pt.28).

Output

Time of computation (sec., floating pt.).

INCONVER

Function

To convert to their proper computational units the input parameters Ω_n , ω_n , i_n , e_n , and M_n , (e.g. Ω_n is converted from degrees/dayⁿ to radians/secⁿ).

Calling Sequence

RJP INCONVER
Normal return

Input

Input parameters in floating-point in "Storage Areas Read", and a constant which converts from degrees to radians.

Output

Converted parameters in floating-point in "Storage Areas Read."

Storage Areas Read

MZERO, . . . , MFIVE
EZERO, . . . , EFIVE
IZEROX, . . . , IFIVE
WZERO, . . . , WFIVE
RAMZERO, . . . , RAMFIVE
CONVERCON

Storage Areas Written

(Same as "Storage Areas Read") SECCNT

Method

Each successive higher-order parameter of a group has the form,

$$x_n / \text{day}^n \quad n = 0, \dots, 5$$

and is converted accordingly to

$$\frac{x_n \left\{ \begin{array}{l} \text{radians} \\ \text{or rev} \end{array} \right\}}{\text{sec}^n}$$

In order to obtain greater accuracy in further calculations, before the mean anomaly is converted to its proper computational units, its integer portion is dropped to allow for more significant digits in its fractional portion.

Error Conditions

None.

TCONVERT

Function

To convert the present date to its Julian equivalent.

Calling Sequence

Error Conditions

Overflow during arithmetic operations or an error in geometric operations. Both types of errors must be remedied before the calculation may be continued.

PREDICTE

Function

To calculate the eccentric anomaly by an iterative method.

Calling Sequence

RJP PREDICTE
Normal return

Input

Mean anomaly, (binary point 26),
eccentricity, (binary point 29)

Output

1. Predicted value of eccentric anomaly (binary point 26).
2. Value of eccentric anomaly used in further calculations after a comparison of predicted value and actual calculated value (binary point 26). (ELLAST contains current value being used - E2LAST contains last value used.)

Subroutine Used

SINX

Storage Areas Read

MM, EE

Storage Areas Written

ELLAST, E2LAST, EGVAL

Method

The first and second times through the routine a value of eccentric anomaly E is predicted from the following equation:

$$(1) \quad E(t) = M + \left(e - \frac{e^3}{8}\right) \sin M + \frac{1}{2}e^2 \sin 2M + \frac{3}{8}e^3 \sin 3M$$

After the second time through the routine a value of E is predicted from the equation:

$$(2) \quad E(t) = 2E(t-\delta t) - E(t-2\delta t)$$

Then the exact value of E is calculated from the equation:

$$(3) \quad M_n = E_n - e \sin E_n, \quad \Delta E_n = \frac{M - M_n}{1 - e \cos E_n}, \quad E_{n+1} = E_n + \Delta E_n$$

By iteration a ΔE is found which is less than ϵ .

Error Conditions

Geometric and arithmetic errors only.

MCALMOD

Function

To make modulo 2π and measure in a positive direction the angles, $M(t)$, $i(t)$, $\omega(t)$, $\Omega(t)$ and to convert to fixed point and store $M(t)$, $e(t)$, $i(t)$, $\omega(t)$, $\Omega(t)$.

Method

When the jump option is used the time of computation is calculated in the following way:

$$(1) \quad t_s = \text{CELTIME} + n(\text{FRAMESIZE})$$

$$(2) \quad t = t_s + \frac{1}{2} \Delta t$$

When $t > t_s + j \Delta t$, t_s is replaced by $(t_s + j \Delta t)$ and (2) is repeated giving a new time of computation

t_s = start time

t = time of computation

Δt = jump interval where $j=1,2,3,\dots$

$n = 4$, when simulation run

1, when realtime run

Error Conditions

13. ABSTRACT		
<p>As one of its options, the Haystack pointing system can track satellites. Given mean orbital parameters of the type used by the Smithsonian Astrophysical Observatory, the Satellite program obtains osculating elements where the perturbations are caused by the ellipsoidal shape of the earth. From these elements, the program computes celestial coordinates and their rates of change which are used by other programs in the pointing system to provide antenna pointing angles, range, and doppler.</p>

REPLY TO
ATTN OF:

ESTI/TSgt Wreck/4535

NOV 6 1965

SUBJECT: CFSTI Release of Lincoln Reports

TO: ESRL (Lt. Col. Wisniewski)

I. A phone call was received from Mr. James Wade, Defense Documentation Center (DDC), on 26 October 1965, questioning the advisability of the release of the following unclassified Lincoln Reports to the Clearinghouse for Federal Scientific and Technical Information (CFSTI).

ESD-TR-65-422 (Lincoln Report TN 1965-36) Subject: Haystack
Pointing System: SATELLITE

ESD-TR-65-423 (Lincoln Report TN 1965-37) Subject: Haystack
Pointing System: BELT

2. Please advise us of your decision in order that we may answer DDC's query.
